## ***Implementation***

### **Problem Statement:**

The problem we are going to solve is designing a robotic controller that can use the sensors to walk through the maze and arrive the destination without crashing into the wall. The robot has six different direction sensors, three on the front, one on the left, one on the right and one on the back. The robot can take four actions: move one-step forward, turn left, turn right, or stay. Each route can be one solution and can be scored, we can find the fittest solution by comparing the scores we get. The purpose of this project is not to train a robot to solve the maze, our purpose is to automatically program a robot controller with six sensors, so the robot won't crash into the wall, and the maze in this case represent the complicated environment in the world.

### **Phenotype:**

We dedicate Individual class as Phenotype, which contains one genotype.

### **Genotype:**

In individual class (Phenotype), we have one chromosome and its type is `int[]` with binary value 0 and 1. We call 0 and 1 value as gene.

### **Fitness:**

The fitness score is a number that represents how good a solution to the problem this individual is. The fitness of each solution is calculated by the route. We initially set the route we want and calculate the route provided by chromosomes. In each route, we calculate whether this route passes through the route we set, and it will be scored.

### **Crossover:**

We choose the highest fitness solution by ***tournament selection***, which is the higher an individual's fitness the greater chance that the individual will be chosen for ***single point crossover*** and mutate for the next generation. In this crossover method, a single point in the

chromosome is picked at random, then any genetic information before that point comes from parent A, and any genetic information after that point comes from parent B. The final solution will be found until the number of generations reach the maximum we set.

### **Initialization:**

The maze object we've created uses integers to represent different terrain types: 1 defines a wall; 2 is the starting position, 3 traces the best route through the maze, 4 is the goal position and 0 is an empty position that the robot can travel over but isn't on the route to the goal.

This code contains a public method to get the start position, check a position's value and score a route through the maze.

The scoreRoute method is the most significant method in the Maze class; it evaluates a route taken by the robot and returns a fitness score based on the number of correct tiles it stepped on.

The score returned by this scoreRoute method is what we'll use as the individual's fitness score in the GeneticAlgorithm class' calcFitness method.

### **Expression:**

We define one chromosome as one solution. Each solution indicates a series of possible actions by binary code, such as

```
100111011100010011101001011010100000010011110011010101100101011111000110101  
10101001000010101011101000101101001110010110001100100.
```

Our robot will have four actions: do nothing, move forward one step, turn left and turn right.

These can be represented in binary as:

- "00": do nothing
- "01": move forward
- "10": turn left
- "11": turn right

## ***Execution***

We use *IntelliJ* as our IDE for this project, and the framework we use is *Maven*, we have five different packages: *controller*, *helper*, *impl*, *repository* and *robot\_main*. We put the robot controller under *controller* package, put maze generator under *helper* package, put our Interfaces under *repository* package, put our implements for Interfaces under *impl* package and put our Main class under *robot\_main* package, we also have a maze folder to store our maze and a test package to store our tests. **To execute our project**, you need to run the Main class under *robot\_main* package, then it will call the controller class to run our program, you also need to input the Maze name in the console, for example, input “*Maze1*”, we have 4 different Mazes, if you want to run the default Maze, you can just press *Enter*.

## ***Classes***

### **GeneticAlgorithmImpl Class:**

Inherited from GeneticAlgorithm Interface. Implement Genetic Algorithm.

### **IndividuallImpl Class:**

Inherited from Individual Interface. About Individuals, including chromosome and fitness. It represents to one route solution in this problem.

### **MazeImpl Class:**

Inherited from Maze Interface. Define the Maze which contains the route and score the fitness.

### **PopulationImpl Class:**

Inherited from Population Interface. It's related to the array of Individual.

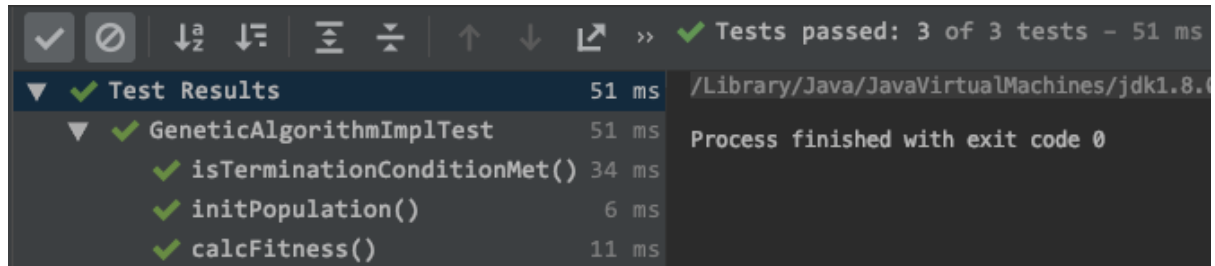

### **RobotImpl Class:**

Inherited from Robot Interface. About all sensors and make the decisions of actions.

## Experiment

### Test:

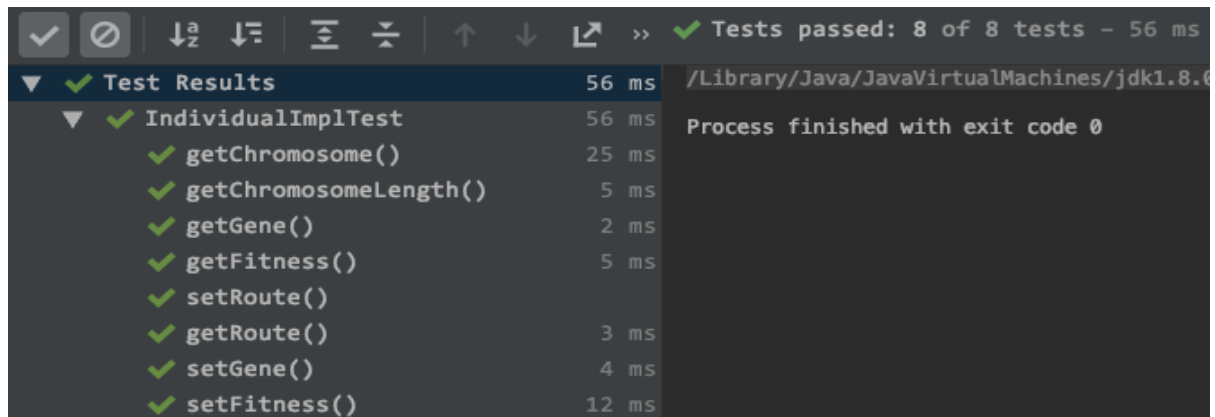

#### Genetic Algorithm

Tests passed: 3 of 3 tests - 51 ms

Test Results	51 ms	/Library/Java/JavaVirtualMachines/jdk1.8.0_101-jre/bin/java -Djava.library.path=.
GeneticAlgorithmImplTest	51 ms	Process finished with exit code 0
isTerminationConditionMet()	34 ms	
initPopulation()	6 ms	
calcFitness()	11 ms	

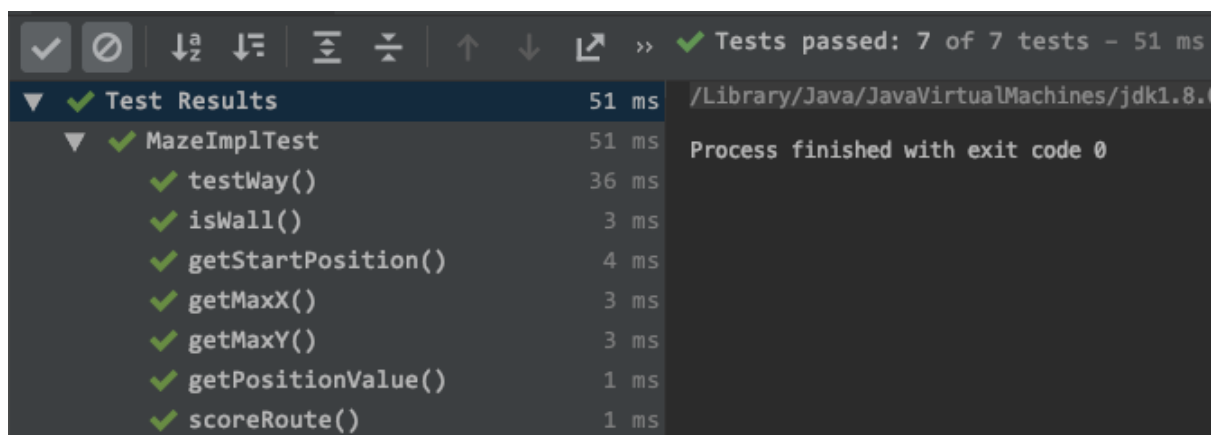

#### Individual

Tests passed: 8 of 8 tests - 56 ms

Test Results	56 ms	/Library/Java/JavaVirtualMachines/jdk1.8.0_101-jre/bin/java -Djava.library.path=.
IndividualImplTest	56 ms	Process finished with exit code 0
getChromosome()	25 ms	
getChromosomeLength()	5 ms	
getGene()	2 ms	
getFitness()	5 ms	
setRoute()		
getRoute()	3 ms	
setGene()	4 ms	
setFitness()	12 ms	

#### Maze

Tests passed: 7 of 7 tests - 51 ms

Test Results	51 ms	/Library/Java/JavaVirtualMachines/jdk1.8.0_101-jre/bin/java -Djava.library.path=.
MazeImplTest	51 ms	Process finished with exit code 0
testWay()	36 ms	
isWall()	3 ms	
getStartPosition()	4 ms	
getMaxX()	3 ms	
getMaxY()	3 ms	
getPositionValue()	1 ms	
scoreRoute()	1 ms	

## ***Fittest Route***

### *Different Generation Times*

maxGenerations=10

maxGenerations=100

maxGenerations=1000

According to the result above, different generation times correspond to different fittest route result. When we generate it 10 times, the fittest route stop in the middle. When we increase the generation times to 100, it has better solution, but still not reach our goal position. When we increase the generation times to 1000, it reached our goal position.

### *Different Population Size*

Population Size=10

Population Size=100

According to the result above, different population sizes also correspond to different fittest route result. When the population size is 10, the fittest solution is not reach our goal position. When we incrate the population size to 100, we reach our goal position.

On the basis of our experiment above, we decided to setup our max generation times as 1000, and the number of population size as 200.

Chromosome of the best solution (Fittest=30.0):

100110110001011111101100010010100110011011110111010001000111011100000100101  
10110010101110110010011000101000101110101110001000100

*Maze2:*

0	1	3	3	2
0	1	3	1	1
1	1	3	1	0
3	3	3	1	0
4	1	1	1	0

(5x5)

Best solution (8.0):

111110100110010011101100010011101010101001110111110101010101011000001010111  
10010110110001010011010000111101101111010010011110110

*Maze3:*

2	1	1	4
3	1	3	3
3	1	3	1
3	3	3	1

(4x4)

Best solution (9.0):

```
0011010101011110100011110010100010001000110100011111101000110011001011000001
00111001110000110111011111001000001101100011011100111
```

*Maze4:*

2	1	0	0	0	0	0	0	0
3	1	0	1	1	1	1	1	1
3	3	1	1	1	3	3	3	1
1	3	1	3	3	3	1	3	1
1	3	3	3	1	1	1	3	1
1	1	1	1	1	1	1	3	1
3	3	3	1	3	3	3	3	1
3	1	3	3	3	1	1	1	1
4	1	1	1	1	1	0	1	0

(9x9)

Best solution (28.0):

```
100111110111011011101110001001100000100100110111100001100100011101001000101
10100100111100110011000010101111001010101011111010100
```

In above experiment, we can see the fittest route result match the route we setup in the Maze, and the number of fitness is equal to the number of 3 and 4 in the Maze.

## ***Conclusion***

Genetic algorithms can be used to design sophisticated controllers, which may be difficult or time consuming for a human to do manually. By giving the robot a maze and a preferred route, a genetic algorithm can be applied to find a controller that can use the robot's sensors and successfully navigate the maze.
